

## Claw Glaze Lacquer Glazing Putty Handling Instructions

A premium quality putty lacquer for filling all surface imperfections and sanding scratches. It spreads easily and smoothly, and with proper application, dries quickly. It affords amazing adhesion, has good flexibility, minimum shrinkage and sands readily without paper clog, with excellent feather-edge. Claw-Glaze adheres well on bare metal, but for best results, use over primed surfaces.

### Directions for Use

Apply a thin coat with rubber or plastic squeegee to clean, dry, well sanded surface, free of all impurities. When surface is very rough, repeat applications as necessary to achieve smoothness and correct contour.

With proper application under normal conditions, Claw-Glaze will dry ready for sanding with wet or dry sandpaper in 15-20 minutes at 70°F., or warmer. Allow longer drying time before sanding when used in cooler temperatures.

Surface is now ready for finishing with an acrylic, lacquer or synthetic refinishing system.
